

RECOMP II USERS' PROGRAM NO. 1125

PROGRAM TITLE: SPECIFIC VOLUME ANOMALY PROGRAM

PROGRAM CLASSIFICATION: General

AUTHORS: Jacqueline Webster, David McGill
Woods Hole Oceanographic Inst.
Woods Hole, Massachusetts

PURPOSE: To compute specific volume anomalies from oceanographic station data.

DATE: June 4, 1962

DISCLAIMER

Although it is assumed that all input data points have been taken in check and that reasonable care has been exercised by the original data collector, no guarantee of correctness can be given. The user of this program is responsible for the use of the output data in this program. Output data may be used or resold by Autonetics Industrial Products, Inc., or its subsidiary, North American Aviation, Inc., without the written permission of this program. No warranty, express or implied, is extended by the use or application of this program.

I

1.0 INTRODUCTION

Given the temperature and salinity at depth, it is desired to describe the density field. In oceanography, the reciprocal of the density, called the specific volume, is generally used. For convenience in application, this is expressed as an anomaly, i.e. the difference between the actual specific volume and the specific volume of water of salinity 35‰ at 0°C.

2.0 METHOD

The techniques described in Processing Oceanographic Data by E. C. LaFond (1951, U.S. Hydrographic Office Publication #614) were used, corrected according to the original publication by Ekman in 1908 (Ref. in LaFond).

The specific volume, $\alpha_{s,t,p}$, is computed as follows:

(t is the temperature in °C

p is the pressure in decibars, equivalent to the depth (d) in meters

s is the salinity in ‰)

First, the following quantities are computed:

$$A_t = 10^{-3} t \quad [4.7867 - 0.098185t + 0.0010843t^2]$$

$$B_t = 10^{-6} t \quad [18.030 - 0.8164t + 0.01667t^2]$$

$$C_t = 28.33 - 0.551t + 0.004t^2$$

$$D_t = 105.5 + 9.50t - 0.158t^2$$

$$E_t = 147.3 - 2.72t + 0.04t^2$$

$$F_t = 32.4 - 0.87t + 0.02t^2$$

and $G = \frac{4886}{1 + 10^{-4}} - 227$

$p(.183)$

Then $\sigma_o = -0.069 + 1.4708 \frac{(s - 0.030)}{1.805} - 0.00157 \frac{(s - 0.030)^2}{1.805} + \frac{0.0000398}{1.805} \frac{(s - 0.030)^3}{1.805}$ *1

$$\sum_t = - \frac{(t - 3.98)^2}{503.57} \left(\frac{t + 283}{t + 67.26} \right)$$

$$\sigma_{s,t,o} = \sum_t + (\sigma_o + 0.1324) \left[1 - A_t + B_t (\sigma_o - 0.1324) \right] \quad *2$$

and

$$\alpha_{s,t,o} = \frac{1}{1 + 10^{-3}} \sigma_{s,t,o}$$

The specific volume $\alpha_{s,t,p}$ is found:

$$10^5 \alpha_{s,t,p} = \alpha_{s,t,o} \left\{ 10^5 - 10^{-4} p \left[G - tC_t + 10^{-4} p (Dt - 10^{-4} p \times 1.5t) + \frac{(\sigma_o - 28)}{10} (-E_t + 10^{-4} p F_t) + \frac{(\sigma_o - 28)^2}{10} (4.5 - 0.1t - 10^{-4} p (1.8 - 0.06t)) \right] \right\}$$

$$\text{Then } 10^5 \alpha_{35,0,p} = \alpha_{35,0,0} \left\{ 10^5 - 10^{-4} p \left[G + 105.5 \times 10^{-4} p - (\sigma_{35,0,0} - 28) (14.73 - 3.24 \times 10^{-4} p) \right] \right\}$$

*1 The value of $s - 0.030$ represents the CHLORINITY, defined according to
 1.8050
the determinations of Knudsen in 1901 (Ref. in LaFond).

*2 $\sigma_{s,t,o}$ is more commonly known as σ_t . Printing out σ_t would involve
only a small modification to the program.

where G is defined above and

$$\alpha_{35,0,0} = 0.972643; \sigma_{35,0,0} = 28.126$$

Finally, the specific volume anomaly, $10^5 \delta$, is computed:

$$10^5 \delta = 10^5 \alpha_{s,t,p} - 10^5 \alpha_{35,0,p}$$

$10^5 \delta$ is printed and punched out.

3.0 RESTRICTIONS

- a) The typewriter is used for direct input of data and output of results. The punch is also used for output of results.
- b) The data for a station must be in order of increasing depth.
- c) The program uses subroutines AN-002 and AN-015.

4.0 USAGE

- a) The program occupies 0001 - 1227.
- b) Typewriter tabs should be set up for 4 columns of data (e.g. left margin at 10 and tabs at 25, 40, 55, and right margin greater than 70. Set toggle switch on typewriter to TAB.
- c) Operating Instructions
 - 1) Read in and verify program tape.
 - 2) Press START 1. A location counter setting of 1247 will be punched onto the tape. Typewriter will type STATION.
 - 3) Type in station number (must have 4 digits). Station number will be punched on tape, and headings D, T, S, DELTA will print out.
 - 4) Machine will wait for data input with location counter at 7775.1. Type in the depth, followed by a tab, and then type in the temperature, and the salinity, tabbing after each entry. After the salinity is entered, computing will start, and $10^5 \times$ specific volume anomaly will be punched out.

NOTE: If an error is made in typing data, press slash (/) key, and computer will be re-set to accept the corrected depth, temperature, and salinity.

Pressing START 3 will also set computer up for corrected data.

5) Repeat step 4 until the end of the station is reached. At the end of a station, press error reset and clear buttons. Then press START 2. An ending will be punched on tape.

6) For more stations, repeat procedure from step 2.

d) The punched tape output from this program may be used as input to the WHOI dynamic heights program. To suppress this punched output the following changes should be made to the program:

Locations 0355: -0000000 + 5703600, 0452: + 5704530 - 0000000 and 0454: + 5704621 + 7477600.

5.0 EXAMPLE

Sample problem:

see enclosed page with typewriter input and output shown for Crawford 0421

6.0 CODING INFORMATION

a) Constants: The number of constants is large, so no list is made here. See the symbolic program listing for constants.

b) Subroutines

AN-002 0500 - 0637

AN-015 0650 - 1127

c) Temporary storage for input:

d (depth) in locations 0074 -75

t (temperature) in locations 0160 -0161

s (salinity) in locations 0076 -77

Temporary storage for output:

d (depth) in locations 0474 - 75

Delta ($10^5 \times$ specific volume) in locations 0130 - 31

d) Timing estimates:

The average timing for a typical set of station data is:

Printing of headings and entering of station number.....8 sec

Entering of one set of d,t,s.....7.4 sec

Computation of δ and print-out of δ 5.7 secPunch-out of d and δ 2.2 sec

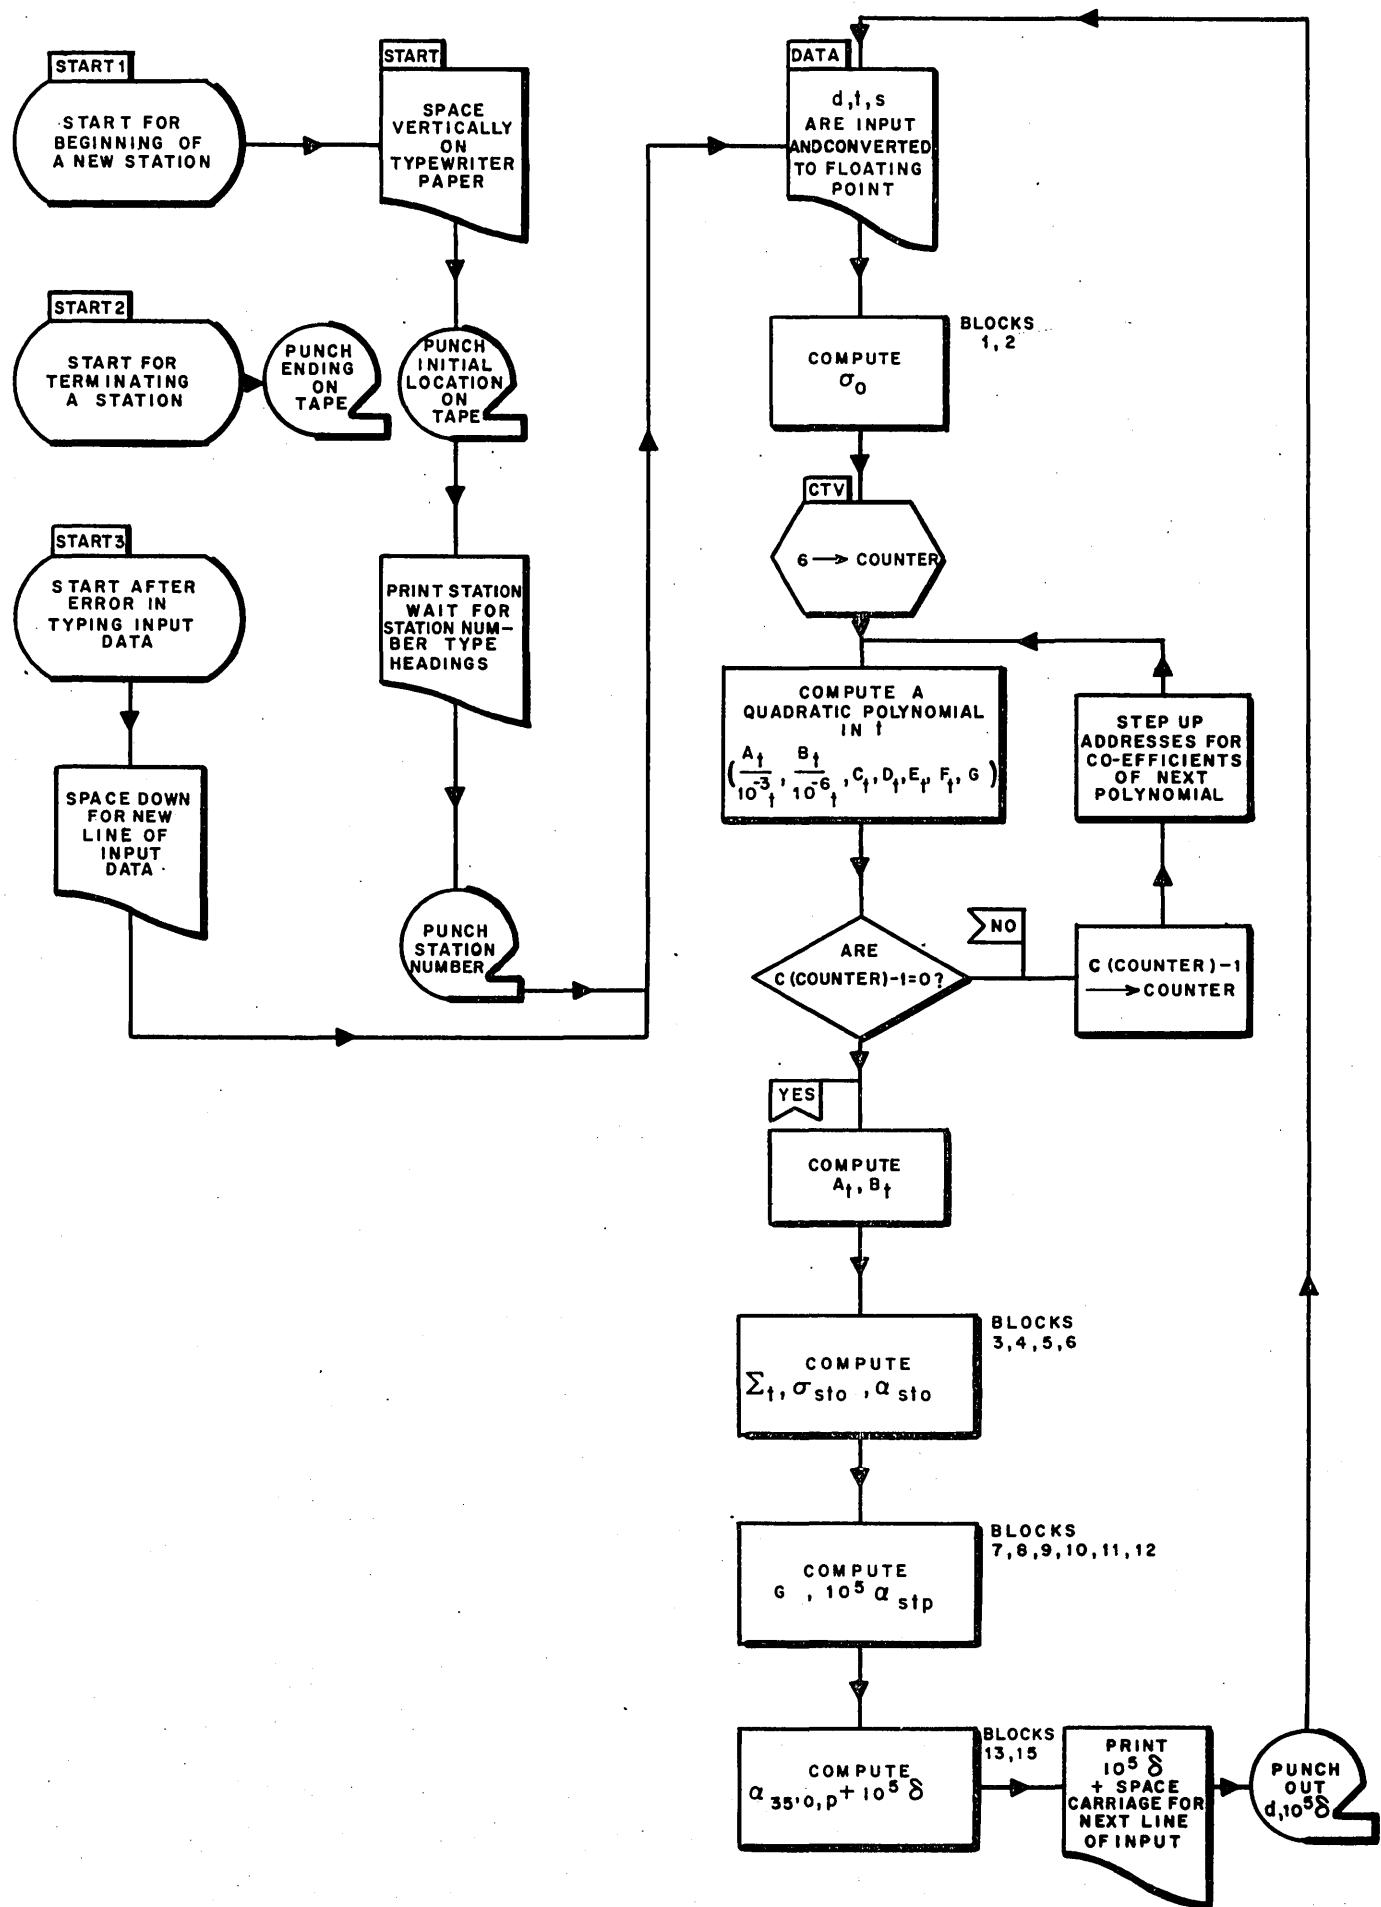

For one entry of d,t,s.....15.3 sec

Total time to run average station of 25 entries = 390.5 sec

= 6.5 min
